## 1. PROBLEM STATEMENT

- **What is the problem? Who does it affect, and how?**

During my internship at Aditya Birla Capital, part of my work involved conducting an analysis of the social media activities of competitors related to Aditya Birla Sun Life Insurance (ABSLI). The analysis involved going through the social media posts of different life insurance companies on various platforms such as Instagram, Facebook, YouTube, and X (formerly Twitter) to check what type of message and communication approach competitors are using, what customer segments they are targeting, what format of posts they are using, and how much engagement they get from users. The entire process had to be done manually by investigating each social media post of competitors and logging down the findings in Microsoft Excel and PowerPoint. As the number of the competitor's social media content kept increasing, the process became too repetitive, laborious, and hard to control, especially when it comes to running comparison between many different competitors. In addition, as the analysis process depended on manual classification of the content, there was no possibility to ensure a standardized approach to classifying the content and identifying the common communication patterns. The limitations of the existing analysis methodology resulted in the decreased efficiency of the benchmarking process and caused delays in producing structured information for creating high-quality content plan and campaigns.

- **How is the problem currently being solved (without AI)?**

Prior to implementing the AI-assisted methodology, competitive analysis had to be done solely through manual observation and documentation. Content from social media networks regarding top life insurance brands was examined separately for various platforms including Instagram, Facebook, YouTube and X so the themes of communication, frequency of posts, types of content and engagement patterns could be analysed. The information obtained was sorted into a Microsoft Excel file and prepared in the PowerPoint presentation format in order to provide benchmarking on competitors and plan content for the future use. The findings of consumer research and manual observations were also used to understand the strategy of communication. Although the methodology was effective, it demanded considerable amounts of time and efforts especially when working with several brands at the same time and across various platforms. As the methodology was based only on individual opinions, it was difficult to ensure stability in the classification of contents and the definition of communication patterns.

- **Why is AI a viable solution for this problem?**

AI can be used as an effective tool just because competitor content analysis consists of analysing many non-structured pieces of information from social media channels, discovering the typical interaction of the audience, and then coming up with useful conclusions on the information. The work of such a kind is tedious and takes too much time with the use of manual work. But AI can simplify the work being done with respect to the analysis of the social media content by finding out the major topics in the posts, as well as identifying the audience segments, content types, and means of communication. AI allows for easier analysis

of competitive strategies and faster summarizing of the information for the purpose of marketing with the help of AI text processing. Thus, it simplifies the work of human decision-makers while eliminating the amount of time necessary for the analysis of different pieces of information. At the same time, AI is a tool that needs support from the human side. The completed analysis still should be double-checked in order to get the proper results. The combination of AI-supported analysis with human decision-making can make the process of competitor content analysis much easier and clearer.

▪ **When did you identify this problem, and who confirmed it was real?**

The issue became apparent in the beginning phase of the internship while performing competitor research and social media planning for the period of April-May of 2026. While studying the content of several competitors in life insurance industry on various social media sites, it turned out that manual process of reviewing and analysing huge volume of data took too much time and effort. The repetitiveness of the entire process and problems with classifying content drew the conclusions about the limitations existing in the methodology chosen for this particular analysis. This issue was raised during the process of regular planning of activities for creating content when it was decided that some improvements are needed to make the analysis more efficient. The confirmation from the supervisor also justified the need for finding a solution based on AI since the manual analysis of content is time-consuming.

## 2.AI SOLUTION

▪ **What did you build? Describe the solution in plain language.**

While working at Aditya Birla Capital, I created a framework that comprises AI-assisted competitor content analysis and campaign planning. The framework employs ChatGPT and MS Excel to analyse and organise available social media content from leading life insurance companies like Facebook, Instagram, YouTube and X. The collected posts are classified by the AI into various categories based on communication themes, audience segments, consumer values, content types and communication styles. The findings are recorded and summarized beforehand into a comprehensive framework that helps benchmark competitors and develop necessary campaigns. The framework serves an important purpose of supporting human judgement rather than replacing it.

▪ **What tools or platforms did you use to build it?**

| Tool/Platform        | Purpose                                                                                                                             |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| ChatGPT              | Content classification, communication theme identification, competitor comparison, insight generation and campaign recommendations. |
| Claude AI            | Content refinement, report structuring and validation of communication outputs.                                                     |
| Microsoft Excel      | Recording, organising and tracking competitor content, content categories and analysis observations.                                |
| Microsoft PowerPoint | Presenting competitor insights, campaign concepts and analysis findings.                                                            |

|                                    |                                                                                 |
|------------------------------------|---------------------------------------------------------------------------------|
| Instagram, Facebook, YouTube and X | Source of publicly available competitor social media content used for analysis. |
|------------------------------------|---------------------------------------------------------------------------------|

The report examines the changing consumer behaviours and preferences of Generation Z in the field of sustainable fashion. Being the first digital generation, Generation Z has been having more economic power and very strong environmental values. This makes them a potential force that can alter retail market dynamics. The report summarizes all the research done to study the reasons for this cohort's sustainable consumption. Among those reasons are the demands for brand transparency, authenticity, and fairness. The report also addresses the contradictions in their behaviours, regarding what is called "value-action gap," which means the discrepancy between people's attitudes towards sustainability and their purchasing behaviour.

#### ▪ **What data or documents did the solution use?**

The framework of AI-powered solutions was created with the use of publicly accessible information about other companies and its own documentation related to the internship position. Taking into consideration the stated above, the main source of information used was social media data coming from the pages of leading private insurers on Instagram, Facebook, YouTube and X platforms, which involves various posts published by competitors such as captions, reels, videos, campaigns, analysis of the engagement, and information regarding the frequency of publishing and communicating. The data gathered was manually analyzed with the help of Excel for further analysis and comparison of all the competitors.

Besides the information from the social media, the suggested solution would make use of other documents used at the time of the internship, among which competitor analysis documents, classification templates for content, research findings regarding consumers, documents providing information about the target segment, and documents dedicated to campaigns. All the mentioned above documents were necessary for understanding the unique communication strategies of different companies and searching for similar patterns of content among them. Then, structured AI techniques were used in order to conduct the analysis of the data received, classification of information into certain categories, analysis of the themes of communication, comparisons of different competitors and recommendations on communication for effective marketing communication strategy.

#### ▪ **What does the solution produce as its output?**

This AI-enabled platform produces structured and valuable results that are suitable for competitor analysis and marketing communication planning. After analyzing the data of gathered competitor content, the AI-based system organizes posts from social media into different categories, finds types of signals and segments of the audience, identifies values of consumers and other aspects of marketing communication. Moreover, it generates narrow content summaries to make the process of benchmarking more clear and interpretable. Apart from content categorization, the AI platform helps to produce comparative analysis outcomes concerning the types of posting strategies, types of mix, methods of engagement, and trends used by competitor companies in order for the marketer to understand the content gaps and find the ways for their differentiation. In addition, regarding the data received, the framework can provide recommendations that can support the investment in content and strategic

communication. Any AI-based output will be screened according to its accuracy and checked before being put in Excel tables, PowerPoint presentations, and campaign plans.

#### ▪ **Limitations of AI solution**

Though this AI assistant framework does raise the level of effectiveness and reliability in its thorough investigation when doing a competitor content analysis, it does have a few drawbacks. First of all, it is totally dependent on the content collected manually, which means it is unable to extract the necessary information from any social media channels. Thus, the quality of data collected by the user should be high enough for the analysis to obtain good results. The quality of the results produced by the assistant also depends on the user's input and whether he/she uses the prompts provided in a proper way. In other words, although this software allows the user to classify content according to its type and topics and generate structured insights, it does not provide independent checks of the output and its compliance with the business needs of a customer. Thus, human validation of the results concerning their relevance and usefulness has to be used. Secondly, the analysis done by the assistant does cover only some kind of publicly available information about competitors and does not include any internal organization information about the audience or campaign results. The assistant has been created with the purpose to solve the tasks of competitor analysis only within the private life insurance industry. Furthermore, the framework does not provide real-time monitoring of competitor activities and requires periodic manual updates to ensure that the analysis remains current. It should therefore be considered as a decision-support tool rather than a fully automated system. Continuous refinement of prompts and regular validation of outputs are necessary to maintain the reliability and relevance of the insights generated.

### **3.SOLUTION LOGIC**

The AI-Assisted Competitor Content Analysis and Campaign Planning Framework functions as a systematic sequence of activities through which raw content generated by competitors is translated into insights relevant to marketing campaigns. The process is started with the collection of available information about competitors' content posted at public social media platforms like Instagram, Facebook, YouTube and X. Data collected is later put in the database created in Microsoft Excel. The next step is having ChatGPT analyze the content collected through the application of carefully designed prompts to identify the type of category of the post in accordance with the preferred method of communication, as well as target audience segment, consumer values and preferred means of communication. The results of the analysis are checked and verified in order to make sure that the generated insights are accurate and reliable for benchmarking and creating planned messages at that stage. Besides that, the framework offers an analysis of communication messages used by different brands, identifies similar trends and gaps in the content while providing recommendations at this stage as well.

Competitor Social Media Content

AI Content Classification

Theme & Pattern Analysis

Human Review & Validation

Competitor Insights &  
Campaign Recommendations

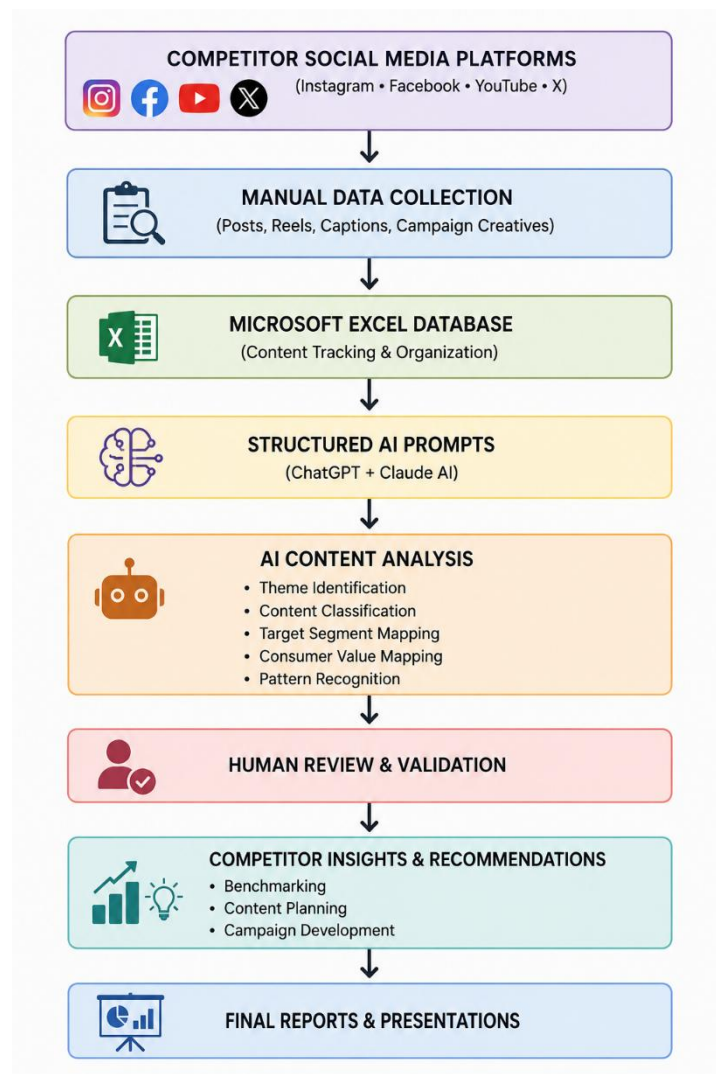

Final Reports & Presentations

#### 4. PROTOTYPE MODEL

The developed prototype is based on the AI-oriented approach to competitor knowledge through the use of ChatGPT based procedures as well as the competitors content data published via various social networking services (SNS). The workflows of the given model begin with the collection of the competitor's content in social media like Instagram, Facebook, and others through the manual work. In this case, the obtained information is arranged and organized using the MS Excel software, which enables the implementation of the basic procedures of information analysis through the identification of the communication subjects, communication types, types of customers, as well as specification of the communication engagement level.

The systematized data are then used for the analysis through special ChatGPT prompts which provide structured information and communication input data through the specific tasks established for the marketing communication analysis. Afterwards, the AI performs the classification of the data obtained through the competitor's communications, identification of the effective communication strategies and obtaining the specific recommendations. Thus, the results generated by the AI system are used for the final design of the competitor benchmarking reports and action plans as well as content development processes.

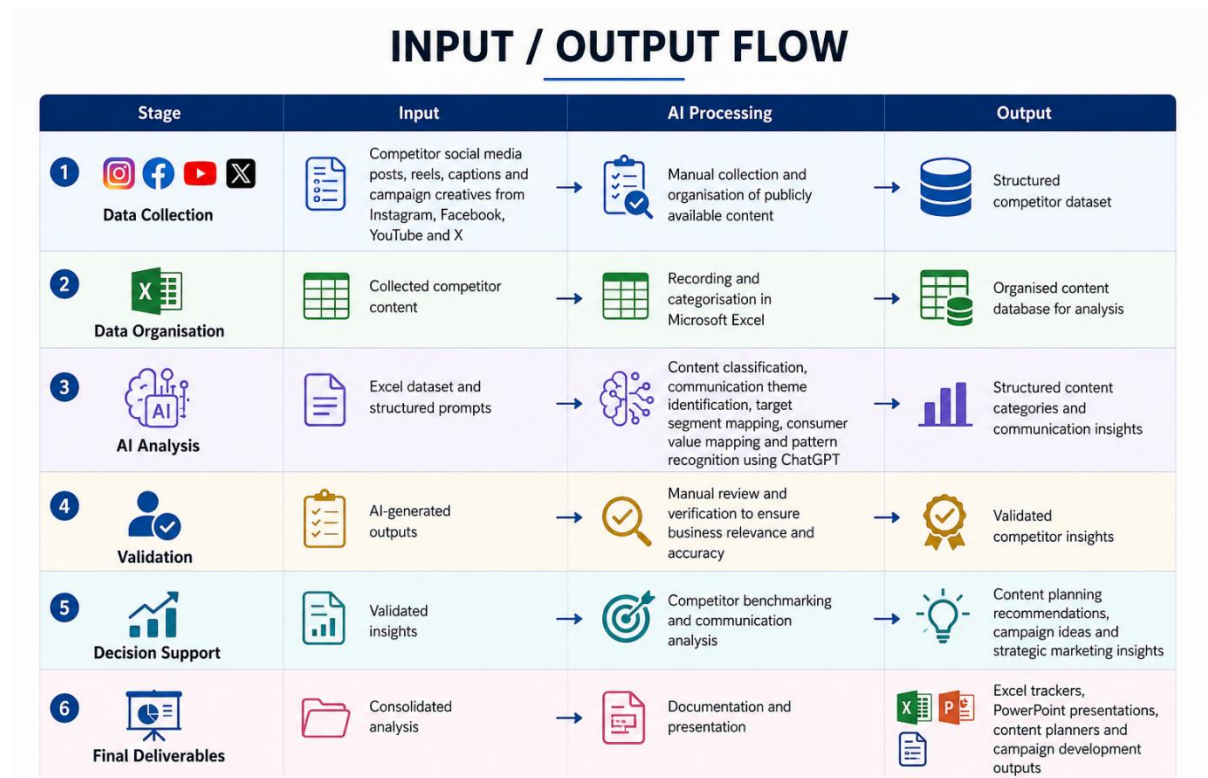

## 5. BUILD NOTES

The process of developing the AI-assisted framework was systematic and iterative throughout the internship. To begin with, data was manually gathered from the official Instagram, Facebook, YouTube, and X pages of the top private life insurance brands regarding their competition. All data collected was then compiled in Microsoft Excel to form a structured database, comprising information on aspects such as communication themes, content types, target segments, posting formats, and key messages.

I designed and improved several structured prompts with the help of ChatGPT, taking into consideration the requests from the client, in order to enable accurate classification of the

content and generation of insights. Numerous iterations of this process were tested to enhance the quality and relevance of the output. The results from AI were validated and then compared with the insights derived manually in order to ensure that the findings obtained coincide with all business objectives and fit into the marketing context.

## 6. INPUT/OUTPUT FLOW

The framework consists of systematic input-output operations whereby publicly available materials about competitors are gathered, organized and processed by means of AI-based commands. The output produced is analyzed and approved prior to being transferred to actionable conclusions for benchmarking, planning and implementation of marketing campaigns. With the help of this structured process, consistency can be achieved, the amount of work can be lowered, and the customer will obtain results much quicker.

## 7. BASIC TESTING EVIDENCE

The AI-driven framework was evaluated with the help of available information obtained through various social media channels used by several prominent private life insurance companies on Instagram, Facebook, YouTube and X. The objective was to compare multiple sets of posts, captions and creatives of the competition in order to see how effective the framework was in classifying the contents, identifying the communication objectives and generating useful marketing observations. A number of variations of prompts were involved in the testing in order to optimize the outputs in terms of their accuracy, relevance and consistency. Afterward, the outputs produced by the AI were compared manually with the

data obtained through human observation in order to confirm that the classifications made corresponded to the reality.

| Testing Parameter | Evidence                                               |
|-------------------|--------------------------------------------------------|
| Data Source       | Public competitor social media content                 |
| Platforms Tested  | Instagram, Facebook, YouTube, X                        |
| AI Tool           | ChatGPT                                                |
| Validation Method | Comparison with manual analysis                        |
| Output Tested     | Content classification, themes, competitor insights    |
| Result            | Consistent and structured marketing insights generated |

## 8.AI DEMONSTRATION AND USE EVIDENCE BUNDLE

### • Deployment level achieved

The application of AI-supported system was classified as Level 1 Deployment Level (Demonstrated in Context) during the internship period. The framework for AI-assisted system application in competitor analysis and communications. It was able to analyse the competitors' public data, determine the communication themes of their messages, identify the trends in data and provide the structured information for future planning of the competitors' activities. The output was used in Excel trackers, PowerPoint presentations and other internship outputs after the review process. The deployment of the AI framework was implemented in the context of real tasks performed during the internship, with the assistance of supervisors from the organization. However, it was not applicable to the actual use by the entire team or implementation into the organization's activities. So, while it was demonstrated and implemented in the work processes, the deployment process was limited with only Level 1 and it did not advance to Level 2, which would mean the implementation of the AI technology to other teams within the organization or even at the organizational level.

### • How was the solution demonstrated / deployed?

The AI-supportive system has been tested in practice during the process of conducting competitor analysis and communication activities aimed at implementing objectives of the internship. Social media content published by leading companies in private life insurance industry was collected from public resources as well as structured on the base of the data obtained through each content and analysed with the help of ChatGPT-supported analysis. The framework was used to group the content into categories, find the communication topics, identify the target segments, and generate the outcome in forms of structured knowledge about competitors. The AI-generated knowledge has been analysed and validated further to be presented in the form of competitor benchmarking spreadsheets, content planners, and presentations. The system has been tested in practice through execution of internship projects instead of hypothetical cases and it enabled such analysis of the activity to be conducted in the reality.

- **Why level 2/3 was not reached?**

The AI-supported model remained at Deployment Level 1 since it was developed and used only within the internship's framework of activities for providing assistance for the assigned marketing communication tasks. Despite the fact that the system was successfully demonstrated in using real case studies regarding competitor analysis and its outputs were discussed with the company supervisor, there was no need to deploy the solution on the organization level. The internship period was focused on carrying out research, benchmarking of competitors, and some other activities rather than implementation of AI in the organization on a large scale. Besides, the limited time of the internship did not allow performing proper training of users, pilot testing, and integration of the model into the organization's workflow. Moreover, to implement this model in the company successfully, it was necessary to have formal agreements, standardized operational procedures, and at least several users to evaluate the system's efficiency. Moreover, the construction of the framework was done nothing more than to create a proof of concept that illustrates the manner in which AI can be used for both competitor analysis and Marketing-related activities without developing an organizational tool. Further use of the framework would necessitate a series of experiments and regular evaluation of the performance of the system. Consequently, the said drawbacks restrict the capability of the proposed solution to a simple demonstration without actual use in the business practice.

- **What broader deployment would require?**

In order for the AI-enhanced system to work on a larger scale, it would be necessary to integrate it into the current practices of the company regarding marketing communication and analysis. This means that the system would need to have a prompt library in place that can provide prompts according to specific needs of the organization. Employees would receive training on how to operate the system, so that they can get maximal benefits from its use in practice and at the same time remain accurate.

The framework would also allow the organization to gain access to the information about its competitors, standardized content practices and performance statistics for analysing the output of the program. It would be reasonable to carry out a pilot implementation that would involve different groups of users, as it would demonstrate the system's reliability and usability. In addition, there should be continuous monitoring of the work of the framework to provide continuous feedback and make the necessary adjustments for getting better results. This would allow the framework to become a true demonstration of the new technology and offer service in the area of marketing communication and planning through the use of AI system.

## **9. ORGANIZATIONAL RESPONSE AND CONSTRAINT BUNDLE**

- **Name/Role, Engagement, Observation**

| <b>Name/Role</b>                       | <b>Engagement</b>                                                             | <b>Observation</b>                                                       |

| Respondent                             | Direct Quote                                                                                                                                                                |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mr. Nikesh Ruparil<br>Corporate Mentor | "The use of AI-enabled technology has allowed us to conduct a more structured competitor analysis with less effort involved in reviewing huge amounts of content manually." |

- **Interest in Continued Use**

The AI-assisted framework received a positive response during the internship as it demonstrated the potential to improve the efficiency and consistency of competitor analysis and marketing communication activities. The organizational mentor acknowledged that the framework could serve as a useful decision-support tool for analysing large volumes of competitor social media content and generating structured insights more efficiently than a purely manual approach. However, due to the limited duration and scope of the internship, the solution was not formally adopted or integrated into the organization's regular workflow. No structured implementation or pilot deployment was undertaken beyond its application within the assigned internship activities. Nevertheless, the framework highlighted the practical value of using AI to support repetitive analytical tasks while retaining human validation for final decision-making. With further refinement, standardized prompt libraries and integration into existing marketing processes, the solution has the potential to support future competitor benchmarking, content planning and campaign development activities. This indicates that while formal adoption was not achieved, the approach demonstrated sufficient value to warrant consideration for broader use in similar business contexts.

- **What would be done differently**

Had we been able to have more time and systematically support, we would have been able to take operations of the AI framework to another level to maximize its potential and applicability. Firstly, we would create a prompt library to enable the implementation of standardized procedures across users and competing brands. Secondly, the operations of the framework could be facilitated by the introduction of automated data collection mechanisms

to obviate the necessity of manual compilation of competitors’ information. Furthermore, testing the system with a larger and more diverse dataset representing several brands and platforms will improve reliability and robustness of obtained findings. More collaboration with marketing specialists in the process of development allows obtaining continuous feedback and prompt modifications in order to meet business requirements. Integration with existing reporting channels and benchmarking procedures will make it more convenient to implement the framework across various teams in practice. Additionally, training sessions will be organized and user manuals developed to help people learn how to use the framework effectively.

## 10. PROOF OF SOLUTION

- **List of proof items**

| <b>Proof Item</b>                                                     | <b>Format</b> | <b>Status / Location</b>            |
|-----------------------------------------------------------------------|---------------|-------------------------------------|

| <b>Final AI Case Write-up &amp; Proof Bundle</b>                      | PDF           | Included in the ZIP                 |

- **Working Tool Description**

The formulated solution is an AI-Based Framework for Competitor Content Analysis and Campaign Planning that integrates ChatGPT and Microsoft Excel. In this approach, competitor social media posts from Instagram, Facebook, YouTube and X are collected and stored in Microsoft Excel for analysis through the application of structured prompts to ChatGPT. The framework builds up the competitor categorization into preset marketing communication categories, identifies the communication topics and groups of targeted customers. In addition, it describes the needs and values, expresses the trust factors and engagement patterns pertaining to content posted by competitors. Further, the framework can produce recommendations concerning the content strategy for Aditya Birla Sun Life Insurance (ABSLI).

- **Deployment**

This solution is not a standalone software application, but rather an AI framework working on workflow principles. It was proved at the internship through the use of ChatGPT, Microsoft Excel as well as the data on competitors that is available online.

- **Platforms Used**

- ChatGPT (OpenAI)
- Claude AI
- Microsoft Excel
- Microsoft PowerPoint
- Instagram
- Facebook
- YouTube
- X (formerly Twitter)

- **Accessibility**

The set of instructions can be duplicated by using the prompt library which is structured, the detailed documentation concerning workflow and the sample data provided within the document. The users can conduct the analysis applying the AI prompts by themselves by gathering the data on competitor's social media platforms and processing the data with the use of MS Excel.

- **Recorded Demonstration**

A proof-of-concept demonstration was conducted to illustrate how AI can be integrated into the competitor content analysis process. To show how AI can be used in the process of competitor content analysis, proof-of-concept demonstration was implemented. During the demonstration, the whole process was presented including: competitor data gathering, content classification with help of AI, analysis of the way competitors communicate with each other, measuring competitors' performance and suggesting ways to improve their performance.

- **Demonstration Objectives**

The recorded demonstration was designed to:

- Demonstrate the practical application of the AI-assisted competitor content analysis framework.
- Showcase the complete workflow from competitor data collection to AI-generated marketing insights.
- Illustrate the integration of Microsoft Excel with ChatGPT for competitor content analysis.
- Validate the framework's ability to generate structured and consistent marketing communication insights.
- Highlight AI as a decision-support tool that complements, rather than replaces, human judgement.

- **Demonstration Workflow**

The process flow for the demonstration is a good illustration of how AI helps in the analysis of competitor content in a step-by-step procedure. The process includes the following phases:

- Gathering of public information issued by competitors through their use of social media channels like Instagram, Facebook, YouTube and X.
- Preparing and organizing competitor data in Microsoft Excel.
- Step-by-step implementation of predefined prompts in ChatGPT in order to process the data.
- Receiving the outputs from AI in the form of communication categories, theme analysis, target segments, consumer values, trust signals, insights on the quality of information and recommendations for campaigns.
- Human check and validation of the AI-generated information before including it in competitor's benchmarking reports, content planners, and campaign recommendations.

- **Supporting Evidence and Validation**

The proposed solution has been validated with several supporting documents that show the design, implementation, and practical execution of the system. All these artefacts prove the feasibility and effectiveness of the AI-assisted competitor analysis process.

The following are the supporting evidence in the submission:

- a. The demo video showing how the AI-assisted competitor content analysis works.
- b. The prototype diagram which shows the entire process.
- c. The flowchart showing the input–output process.
- d. The structured prompt library that shows the prompts as well as the output from the analysis.
- e. The dataset used as input in the analysis.
- f. The conversation link we compiled through ChatGPT showing the prompt engineering process.

- **Conclusion**

The AI-Assisted Competitor Content Analysis & Campaign Planning Framework showed that AI could be applied in a practical manner to study marketing messages as well as to analyse the competition. The combination of structured prompt engineering, competitor datasets and the contribution of specialists in the analysis allowed to generate systematic and structured marketing insights and greatly reduce manual efforts. The prototype showed that AI can serve as a significant support-tool for competitor content analysis, benchmarking and campaign planning but also stressed the importance of incorporating human judgement when validating the results. The framework is still open for improvements with respect to automated data collection, larger datasets and its integration with the entire marketing analytics process.

### **Student Declaration**

I confirm that the problem described in this write-up represents a genuine operational challenge encountered during my internship at Aditya Birla Capital Limited. The AI-assisted solution documented in this report was conceptualised and developed by me during the internship period. The supporting documents attached accurately represent the framework, workflow and prototype developed for this project. The organisational response described in this report reflects the actual observations and feedback received during the internship.
